Re Item V.

- 1 The following documents are referred to in this communication:
 - D1: US 2002/075844 A1 (HAGEN W ALEXANDER) 20 June 2002 (2002-06-20) D2: EP-A-1 191 763 (ROKE MANOR RESEARCH) 27 March 2002 (2002-03-27)
- 2.1 Using the wording of claim 1 and taking references from D1, D1 discloses:

Document D1 discloses (the references in parenthesis applying to this document): "A method for offering wireless network access to both guests and local users (§43), comprising the steps of:

receiving at a wireless network access point a request for access (§48); authenticating the request for access depending on from whom the request was received (§57); and if such authentication is successful, then routing traffic from the local user differently from the guest (§52, 57)".

Therefore, the present application does not meet the criteria of Article 33(1) PCT, because the subject-matter of claim 1 is not new in the sense of Article 33(2) PCT.

- 2.2 Independent claim 9 defines a network which implements the method of claim 1. The same reasoning applies and therefore, the subject-matter of claim 9 is also not new in the sense of Article 33(2) PCT.
- 2.3 Dependent claims 2-8 and 10-14 do not contain any features which, in combination with the features of any claim to which they refer, meet the requirements of the PCT in respect of novelty and/or inventive step (Article 33(2) and (3) PCT).

SUBSTITUTE SHEET PAGE 7

A method for offering wireless network access to both guests and local users, 2 comprising the steps of: receiving at a common wireless network access point a request for access from one of a 3 4 guest and local user; authenticating the request for access received at the common access point depending on 5 6 whether the request was received from the guest or local user; and if such authentication is successful, then 7 8 routing traffic from the local user differently from the guest. 2. 1 The method according to claim 1 further including the step of determining at the 2 wireless network point whether the access request was received from local user or guest. 1 The method according to claim 2 wherein the step of determining whether the 3. 2 access request was received from a local user or a guest further comprise the step of examining a user domain received from a party seeking access to determine whether such user domain 3 4 designates a guest domain. 1 4. The method according to claim 1 wherein the authenticating step further comprises the step communicating a request for authentication to separate authentication servers 2

5. The method according to claim 1 wherein the authenticating step further comprises the step communicating a request for authentication to a single authentication server which performs authentication using different credentials for local users and guests.

depending on whether the party seeking access is a local user or a guest.

- 6. The method according to claim 1 wherein the authenticating step further comprises the step of ascertaining whether the request for access included an authentication request was received in an IEEE 802.1x format or was received in a web-browser format.
 - 7. The method according to claim 1 according to claim 1 wherein the routing step further comprises the step of routing traffic from a guest to an external network.

- 8. The method according to claim 1 wherein the routing step further comprises the step of routing traffic from a local user to a corporate intranet.
- 9. A wireless Local area network for offering wireless Network access to both guests and local users, comprising:
- at least one common wireless network access point offering access to both guests and local users in response to a request for access;
- at least one server coupled to the at least one wireless network access point for authenticating the request for access depending on whether the request was received from the guest or local user; and
 - means coupled to the at least one wireless LAN access point for routing traffic from the local user differently from the guest.
 - 10. The network according to claim 9 wherein the at least one wireless network access point determines whether the access request was received from a local user or a guest.
 - 11. The network according to claim 10 wherein the at least one wireless network access point determines whether the access request was received from a local user or a guest by examining if a user domain received with the access request indicates a guest domain.
- 1 12. The network according to claim 9 wherein the authentication server performs 2 authentication using different credentials for local users and guests.
 - 13. The network according to claim 9 wherein the at least one wireless network access point ascertains whether the request for access was received in an IEEE 802.1x format or was received in a web-browser format.
- 1 14. The network according to claim 9 wherein the means for routing traffic includes a firewall.
